TRIBECA Downlight

Design by Jordi Llopis

Tribeca Downlight designed by Jordi Llopis

Simplicity raised to its highest level: Tribeca 'downlight'

The Tribeca downlight model that we present today is composed by the characteristic spherical alabaster shade from the Tribeca collection, the same one used in the other versions, with the particularity that it can be installed in a false ceiling. The metal structure of this downlight is a simple metal disk made of textured black epoxy painted iron or in a customizable finish, attached directly to the ceiling by springs. This allows the electronics to be hidden in the false ceiling, showing a much cleaner and minimalist design: a stone sphere fixed directly to the surface, without further interference. Its mounting allows its use both on the ceiling and on the walls.

In Tribeca Downlight the light source, as in the rest of the Tribeca collection, is an integrated Seoul 4.5W 2700K 270lm LED that offers a pleasant and elegant luminosity. The driver is always included.

The Tribeca collection includes suspensions with one, two or four shades, two floor models with one shade or two overlapping, a table version, a sconce with or without reading arm, and a ceiling lamp.
